- Deep convolutional networks trained on multiple GPUs for automatic detection of calibration spikes in ECG
 data; achieved an accuracy of over ninetynine percent on ten-fold cross validation with a data set of about
 one million real world samples tested with sigma five significance, which is state of the art
- Residual networks for detection of ECG curves in documents; achieved an IOU of approximately ninetyeight percent on ten-fold cross validation with a data set of about ten million artificially enlarged samples using generative neural networks tested with sigma three significance, which is state of the art
- Image segmentation using matrix factorisation techniques to isolate ECG curves. Achieved an IOU of approximately ninetynine percent tested with sigma six significance, which is state of the art
